Abstract (Basic): WO 9413790 A

Use of a DNA sequence (I) encoding a protein (II) able to degrade oxalic acid as a selection agent for plant cells is new. Partic. (I) is coupled to a sequence of interest and (II) is (a) a decarboxylase or (b) esp. an oxalate oxidase (IIa). The sequences of a pref. (IIa), 224 aminoacids, and of the DNA encoding it (672 bp) are reproduced in the specification.

Transformed calli etc. are selected in a medium contg. oxalic acid an Ca in presence of a chelating agent (esp. EDTA or EGTA) with higher affinity for Ca then oxalic acid.

USE - (I), coupled to (III), is used to select calli and transformed plants (esp. Nicotiana tabacum, Helianthus annuus or Brassica napus) by enabling survival on oxalic acid contg. medium Partic. encodes an enzyme which imparts resistance to pathogens, esp. an endochitinase which is active against many fungi, insects and nematodes. Apart from providing selection, (I) also protects against oxalic acid, a phytotoxin produced b many fungi.
